EXPERIENCE

Goldman Sachs, Associate (Sr. SDE-2 equivalent)

Sep 2024 - Present

- **Data Modeling & Platform Architecture:** Architected a greenfield data platform using AWS (S3, Lambda, Step Functions, Aurora, AWS managed Kafka, CloudFormation, Terraform) and Lakehouse (Databricks). Developed a canonical data model for 10M+ daily trades, positions, and valuations across 100+ global CCPs, establishing a unified source of truth for Risk and Regulatory reporting.
- **Infrastructure & TCO Optimization:** Replaced legacy private cloud/NAS infrastructure with an AWS cloud-native hydration architecture, achieving a 42% reduction in storage/compute TCO (~\$1.2M annual savings) and 99.99% uptime.
- **ISA Collateral Swap Automation:** Automated collateral swap workflows orchestrating vendor eligibility, pledge/recall, and ledger updates. Built an integrated ops UI for manual data corrections, maker-checker exception approvals, and real-time tracking, slashing daily operational processing time from 16 hours to 40 minutes.
- **AI-Driven SDLC Automation:** Extensively utilized Claude Code and GitHub Copilot to accelerate CCP venue onboarding for hydrating margin data into the data lake. Streamlined Jira ticket parsing, schema discovery, code generation, and unit testing, reducing onboarding integration time by 75% (8 weeks to 2 weeks).

MoveInSync, Software Development Engineer-2 - WorkinSync Team

Apr 2024 - Sep 2024

- **VMS Product Leadership:** Assumed end-to-end technical ownership of the enterprise Visitor Management System (VMS) product. Partnered directly with B2B clients like Richemont to extract requirements, architect technical features, and oversee deployment, mentoring a 3-member engineering squad.

Morgan Stanley, Senior Technology Associate (SDE-2 equivalent)

Jul 2021 - Mar 2024

High-Performance ETL Microservices: Engineered a multi-partitioned Spring Batch loader microservice to facilitate brokerage deposits and sub-ledging for global HNI clients. Achieved a 5x performance boost, processing 100M records in just 30 minutes, and reduced system RAM consumption by 80% (15 GB to 3 GB). The numbers recorded via significant performance and chaos testing of the systems and infrastructure involved.

- **Distributed Trade Processing:** Architected a dynamic load distribution service, migrating from legacy MQs to Apache Kafka for real-time event streaming. Handled trade volumes up to 20M (3x capacity) via intelligent auto-scaling and parallelization across multiple VMs.
- **CI/CD & Observability Standards:** Streamlined the SDLC utilizing Blue-Green deployments and Sonar in Jenkins CI pipelines. Established deep observability using Prometheus, Grafana, Spring Actuator, and Micrometer, while drastically reducing testing time via JUnit5, Mockito, and Cucumber.

Morgan Stanley, Technology Summer Analyst

Apr 2020 - Jun 2020

- **NLP & Observability Chatbot:** Developed an NLP-powered operational chatbot leveraging Stanford CoreNLP and the ELK Stack (Elasticsearch, Logstash, Kibana), achieving 92% query accuracy and significantly reducing troubleshooting effort and resolution time for engineering teams.

EDUCATION

Motilal Nehru National Institute of Technology (MNNIT)

Bachelor of Technology • Computer Science and Engineering

CGPA: 8.8/10

SKILLS

Java • kafka • Amazon Web Services (AWS) • Kubernetes • Distributed Systems • Redis • PostgreSQL • Terraform • Python (Programming Language) • Data Lakes

HONORS & AWARDS

GRIT (Grassroots Innovation in Technology) Award

Morgan Stanley •

Received the firm's prestigious GRIT (Grassroots Innovation in Technology) Award specifically for the transformative performance and operational impact of the generic loader microservice.
